

J. Arthur Bower's Bonemeal

J. Arthur Bower's Bonemeal is a natural organic slow-release root-building plant food. A handful added to the planting hole of trees and shrubs gets them off to a good start by encouraging strong root development. Bonemeal can also be used as a general plant food to keep your plants in excellent condition throughout the growing season.

Planting up Trees and Shrubs

Select a position that gives your plant plenty of space to grow.

Dig a hole twice as wide as the container or root system and about 8cm (3") deeper.

Mix 70g (2oz) of Bonemeal with a generous portion of compost or soil.

Distribute this evenly around the bottom and sides of the hole.

Water the container well, carefully remove the plant and place into the hole. For bare-rooted plants, remove the net or plastic before planting in the hole. Tall plants should be supported with a stake.

Set the tree or shrub in position and fill between the roots, making sure no air is trapped. Firm gently, then water thoroughly around the plant base. Water repeatedly especially during dry spells, until the plant is established.

General Plant Feeding

Scatter 140g per sq m (4oz per sq yd) onto the soil.

Lightly fork or hoe in.

Repeat once a month through the growing season.

Preparing Beds, Borders and Vegetable Plots

Scatter 70g per sq m (2oz per sq yd) onto the soil before planting or sowing.

Fork well in.

Application Advice

Do not use where cattle, sheep, goats and deer have access.

Use the recommended amount.

Apply evenly between the plants, without touching the plant itself.

Avoid using on windy days.

Water well in after applying.

Wash hands after use.

Storage

Store in a cool, dry place away from children, pets and foodstuffs.
